

Project Demonstration — Team Involvement in Demonstration

Date	8 July 2026
Team ID	SmartBridge Externship
Project Name	FinRelief AI
Maximum Marks	5 Marks

Team Composition

Name	Role
Sri Datta Sai Vithal Kaligotla	Team Lead
Bhoganaduni Manogna	Member
Jayasree Movva	Member
Sri Satya Lahari Pragada	Member
Krishna Sanjay Pemmaraju	Member

Individual Contributions

Each team member's contribution is drawn directly from the stories they owned and completed across the project's six epics.

Sri Datta Sai Vithal Kaligotla — Team Lead

Owned the project's foundational planning and several cross-cutting features: the overall Project Workflow definition, the Fallback Logic Implementation for the AI negotiation letter feature (the core reliability mechanism of the app), Financial Health Metrics & Settlement Data Visualization on the dashboard, general UI Enhancements, and the project's Conclusion.

Bhoganaduni Manogna

Led the initial system design work — the Entity Relationship (ER) Diagram for FinRelief AI and the project's pre-requisite Links documentation — then moved into AI-facing work with the AI Negotiation Strategy Engine, and closed out with core frontend work: User Interface Development and connecting the Frontend to FastAPI.

Jayasree Movva

Handled backend and frontend environment setup — Backend Dependency Installation (requirements.txt) and Frontend Setup with React and Vite — then took ownership of the API Development Functionality for database management, and led System Testing along with Backend Error Handling & AI Fallback Management during the testing phase.

Sri Satya Lahari Pragada

Set up the Project Structure early on, then built the FastAPI Backend & API Endpoints, followed by Loan & Settlement Processing Functionality. In the later stages, handled Performance Optimization & Secure Session Management, and led GitHub Repository Setup & Version Control Management for the team.

Krishna Sanjay Pemmaraju

Built the core Financial Engine Module and the Settlement Prediction System — the two pieces that calculate a borrower's debt stress and settlement percentage — followed by Data Handling for the database layer. Closed out the project with Project Cleanup & Modular Folder Structure Organization and Deployment Configuration & Production Readiness Setup.

Summary

All 26 stories across the project's 6 epics were distributed across the 5 team members and marked Reviewed on completion, with zero unassigned stories and zero members left without assigned work. Each member owned work across at least two different epics, meaning contributions spanned both backend/AI logic and frontend/deployment work rather than being isolated to a single layer of the stack.
